Problem 1 (2.10.82). Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors in three-dimensional space, where $\mathbf{u}$ and $\mathbf{v}$ are unit vectors which are not perpendicular to each other and

$$\mathbf{u} \cdot \mathbf{w} = 1, \quad \mathbf{v} \cdot \mathbf{w} = 1, \quad \mathbf{u} \cdot \mathbf{v} = 4.$$

If the volume of the parallelepiped, whose adjacent sides are represented by the vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$, is $\sqrt{2}$, then the value of $\|3\mathbf{u} + 5\mathbf{v}\|$ is _____. (2021)

Solution: We are asked to find the magnitude of the vector $3\mathbf{u} + 5\mathbf{v}$. We will compute the square of its magnitude using the formula $\|\mathbf{x}\|^2 = \mathbf{x}^T \mathbf{x}$.

$$\|3\mathbf{u} + 5\mathbf{v}\|^2 = (3\mathbf{u} + 5\mathbf{v})^T (3\mathbf{u} + 5\mathbf{v}) \quad (0.1)$$

$$= 9(\mathbf{u}^T \mathbf{u}) + 30(\mathbf{u}^T \mathbf{v}) + 25(\mathbf{v}^T \mathbf{v}) \quad (0.2)$$

We are given that $\mathbf{u}$ and $\mathbf{v}$ are unit vectors, which means $\mathbf{u}^T \mathbf{u} = 1$ and $\mathbf{v}^T \mathbf{v} = 1$. We are also given the value $\mathbf{u}^T \mathbf{v} = 4$. Substituting these values formally into Eq. (??):

$$\|3\mathbf{u} + 5\mathbf{v}\|^2 = 9(1) + 30(4) + 25(1) \quad (0.3)$$

$$= 9 + 120 + 25$$

$$= 154 \quad (0.4)$$

Taking the square root gives the magnitude:

$$\|3\mathbf{u} + 5\mathbf{v}\| = \sqrt{154} \quad (0.5)$$

There appears to be a contradiction in the problem statement. The vectors $\mathbf{u}$ and $\mathbf{v}$ are given as **unit vectors**. Since the value of $\cos \theta$ must be in the range $[-1, 1]$, the given value $\mathbf{u}^T \mathbf{v} = 4$ is impossible.
